Golang · Payment Acceptance · DevSecOps with MicroVM

Executive Summary

Senior/Principal Engineer with 12+ years of experience architecting scalable, secure, and cost-efficient platforms across fintech, e-commerce, healthcare, digital banking, and enterprise systems. Combines deep technical expertise with a Bachelor of Engineering and a Master of International Business to translate complex engineering decisions into measurable business outcomes. Experienced in cloud-native architecture, high-volume payment ecosystems, platform reliability, and AI-assisted software development using Generative AI and LLMs. Delivered critical technology initiatives for Grab and OVO, alongside healthcare diagnostic engines, telemedicine platforms, digital banking solutions, and ERP systems across Southeast Asia.

Notable projects: Grab and OVO payment ecosystems, healthcare diagnostic engines, telemedicine platforms, digital banking solutions, and ERP systems for leading companies in Southeast Asia.

Technical Experience Summary

- **Programming Languages:** Rust, Golang, Java, Typescript/Javascript, Python, Lua
- **Frontend Tech:** React, Vue JS, Alpine.JS (SSR)
- **Messaging Systems:** Confluent Kafka, RabbitMQ
- **Frameworks:** Express, Spring, Actix, Tokio, Axum, Diesel, Protobuf/GRPC, Temporal, Golang Mux
- **Proxy Systems:** EnvoyProxy, Nginx, HAProxy
- **Cloud Platforms:** Google Cloud, k3s, MicroVM, Google Kubernetes Engine (GKE), OpenShift, OpenStack
- **CI/CD & Infrastructure:** Datadog, Grafana, Prometheus, Jaeger, Stackdriver, OpenSearch, Sentry, GitOps, Terraform, Gitlab, Docker, Packer
- **Databases:** MySQL, Postgres, ArangoDB, Redis, Vector DB (Chroma)
- **AI/ML:** LangChain, LangFuse, LlamaIndex, Claude, Pi Agent.

Work Experience

Grab, South Jakarta, Indonesia

Nov. 2021 – Present

Principal Software Engineer, Payments Tech Family

- Architected and led the consolidation of fragmented enterprise payment gateways into a single payment ecosystem spanning 12+ business verticals. Standardized platform capabilities and integration patterns, unlocking US\$150M in new annual GMV and retiring redundant systems for a 68% infra cost reduction
- Designed and implemented the cloud-native migration of 42+ critical financial services to Google Kubernetes Engine. Established GitOps-based CI/CD governance and automated deployment controls, shortening release cycles from hours to minutes—a 95% improvement—while strengthening consistency, compliance, auditability, and maintainability.
- Led the architecture and migration of a tier-1 payment gateway processing ~15 million transactions per day, holding 99.9% availability, evaluated scalability, resilience, capacity, and phased rollout; led to ~30% cost reduction.
- Established and governed the internal team AI strategy for engineering operations, defining adoption standards, human-in-the-loop validation, agent harness, and quality and security guardrails. Grounded AI-assisted engineering standards in controlled evidence demonstrating 55.8% faster task completion and a 61.2% higher likelihood of passing complete regression-test suites.
- Built and deployed custom AI agents for incident triage and resolution, reducing response time from 2–3 hours to 10–15 minutes—an 88–94% improvement that exceeded industry published automation benchmarks of 20–50%—while increasing ticket-closure throughput and reducing production defects.

PRIXA.AI, Jakarta Pusat, Indonesia

Jan. 2020 – Nov. 2021

VP of Engineering, <https://pria.ai>, 100% Remote Engineering Team

- Led a 15-person engineering team in architecting and delivering seven integrated healthcare products—the Nalar Diagnostic Engine, telemedicine, pharmacy, appointment booking, insurance, payments, and shipping—using Go, Rust, and Vue.js, supporting a platform serving more than 1 million users and contributing to the company's successful Series A funding round.
 - Designed service boundaries and integration patterns across clinical, financial, insurance, and fulfilment workflows, balancing scalability, security, maintainability, and delivery speed across the healthcare ecosystem.
 - Established the engineering architecture roadmap and OKRs, translating business objectives into measurable technical priorities while aligning product and engineering teams around delivery milestones, platform improvements, and technical-debt reduction.
 - Implemented CI/CD pipelines and production-delivery standards that reduced deployment time from approximately two hours to 10–20 minutes—an 83–92% improvement—while strengthening release consistency and engineering productivity.
 - Introduced architectural reviews, engineering standards, and production-readiness practices covering code quality, security, observability, and deployment reliability across the product portfolio.
-

Bank Rakyat Indonesia, Jakarta Pusat, Indonesia <i>Group Head Future Banking Platform, Digital Center of Excellence, https://bri.co.id</i> <i>Group Head Digital Experience, Digital Center of Excellence</i> - Co-led new core banking procurement (60+ billion rupiah) and digital Banking IT implementation for Pinang and Ceria, partnered with Accenture, Finagle (Core Banking), PrivyID, Wavacell, and Telkom - Co-led the procurement and implementation of a new virtual private cloud infrastructure, valued at over 30 billion rupiah. Orchestrated the integration of OpenStack, RHEL, OpenShift, and Cisco SDN technologies, collaborating closely with RedHat and Cisco as strategic partners, resulting in optimal deployment and performance - Led development for next-gen digital loan products (Pinang and Ceria) using Java. Ensured OJK and BI compliance while delivering scalable solutions that met regulatory and business requirements	Jan. 2018 – Jan. 2020
SMBC Bank, Jenius, Jakarta Selatan, Indonesia <i>Senior Software Engineer, Jenius, https://jenius.com</i> - Co-led Jenius 2.0's core banking architecture and API design with McKinsey Digital, leveraging Kubernetes and TypeScript. The improved system reduced customer complaints by 30% and increased user engagement by 220%, delivering a more efficient and scalable banking platform - Led internal code audit with Software Improvement Group (SIG) partner, saved 800 potential bugs and 50+ CVE vulnerabilities	Dec. 2016 – Jan. 2018
Happy Fresh, Jakarta Selatan, Indonesia <i>Software Engineer, Headquarter IT Division, https://happyfresh.id</i> Happy Recipe (Scrum method) – Responsive design for Webapp Happy Fresh (Scrum and Kanban methods) – Mobile Web, Webapp, Android, Backend, and iOS - Architected CI/CD pipelines for web, iOS, and Android using GoCD. Implemented automated acceptance testing with Appium, Cucumber, and Ruby SDK, ensuring cross-platform quality - Implemented multi-platform analytics using Javascript, integrating Optimizely, Segment, Google Analytics, Mixpanel, Amplitude, and Leanplum for data-driven insights.	Sept. 2015 – Dec. 2016
Savant Degrees Pte Ltd., Singapore <i>Full Stack Software Developer, Application Delivery Team, https://savantdegrees.com</i> Projects: - P&G Olay Brand for Philippine and Thailand - P&G Braun Brand for Singapore, and China - Telin (Telkom International) Indonesia, Pre-Sales System	Oct. 2013 – Sept. 2015
Fachhochschule Erfurt, Erfurt, Germany <i>Research Assistant, Faculty of Information Technology, https://www.fh-erfurt.de/</i>	March-June 2011
PT. Vikasa Infinity Anugrah, BSD City, Indonesia <i>Software Developer, ERP Business Consultant</i>	August-December 2009
